

How do you ensure that viruses, spam, and hackers do not compromise your system? Is your network security easy to maintain and operate while providing real-time threat management?

Network security and integrity are paramount for any business' network to function properly. Preventing viruses is not the only line of defense against attacks. Networks come under attacks from spam and phishing, hackers, spyware, and various forms of intrusion. Midwest Computech's unified threat management system, Astaro™ Security Gateway provides the security and efficiency your network needs.

Astaro™

- Employees working off-site or from home (VPN) will have the same protection and network security.
- No need for you to worry about virus scans and updates, Midwest Computech keeps your system ahead of the curve.
- Ability to customize viewable categories of websites.
- Reporting features explain blocked threats and averted security risks.
- Provides simplified compliance for email systems.
- Provides unified management of the whole network so there is no need for proprietary platforms on each user system or multiple platforms at the network level.

Where is technology taking your business?

“Your entire team have always provided great service and quick response with a great attitude. It almost feels like we’re all part of the same organization - true partners. And that breeds a strong trust level. You are our safety net!”

Tim Rich
Executive Director
Heart of Missouri United Way

- Midwest Computech installs the Astaro™ unit to your network and protection begins. The unit is small and can be placed in your existing server rack system.
- The qualified technicians at Midwest Computech provide monitoring of the system to ensure the newest threat management updates are installed and the system is functioning successfully.
- Offering a three pronged approach to protecting your system, the Astaro™ Security Gateway can simultaneously provide network, web, and email security.
- **Email Security includes:** scanning all in and outbound POP3 and SMTP traffic both encrypted and compressed, blocking spam and phishing activities with the latest techniques, providing dual virus protection for all email systems, providing transparent encryption for all emails.
- **Web Security includes:** filtering malicious content from both web and ftp traffic, preventing client infections from web surfing and downloading to your system, and the ability to block access to 20 million+ unproductive websites.
- **Network Security includes:** providing intrusion prevention while augmenting firewalls with deep inspection filtering, securing remote access and VPN clients, allowing management of needed IM and P2P Controls.
