

Do the costs of new servers, user workstations, and software applications worry you? Do you need customized options for multiple employees, or the flexibility of off-site systems?

Cloud computing has brought the capabilities of small and medium sized businesses into the future. Not only does it revolutionize business computing, it also promises to dramatically cut costs by eliminating the need for high powered and expensive individual personal computers. Midwest Computech is on the forefront of cloud computing taking it to the next level with a hybrid system call TruCloud™.

TruCloud™

- No need to replace old desktops and laptops. TruCloud™ virtualizes applications so everyone can have the most up-to-date system applications, no matter what their hardware might be.
- When a new version of Microsoft Office is available all users have the opportunity to use it without purchasing new software for everyone.
- Each user's applications and preferences are customized for increased security and flexibility.
- Save money on software licenses with only purchasing enough for concurrent users.
- Data backup and security is simple and easy to manage.
- With on and off-site hosting options you can maximize the server space you have with virtualization, reducing the number of physical servers needed.

Where is technology taking your business?

“TruCloud is an innovative way to store and control data and has saved us a lot of money. We had a server that crashed and instead of replacing it choose to use the TruCloud system which allowed us to overcome our IT challenges without having to come up with thousands of dollars on the front end. This system also allowed us the flexibility to move in and out of a second facility last year and into a different facility this year and still access our IT data without the expense of additional computer hardware. Midwest Computech has gone above and beyond to provide our IT services with ease and affordability.”

*Valorie Livingston
Executive Director
Boys and Girls Club of the
Columbia Area*

- **Option 1: In-House Server.** Your business can work off of a single on-site server which is virtualized. Unlike other cloud computing options relying solely on internet connections to a cloud provider, Midwest Computech provides your business with savings, efficiencies, and complete network control.
- **Option 2: Data Center Housed Server.** Midwest Computech can house your virtual server at our secure data center. This option provides all the same benefits of an in-house server system without the need for costly equipment.
- **The virtual server allows for usage and space to be monitored and increased when needed without the extra expense of an additional server.**
- **TruCloud™ enables older computers or thin clients to be used and still run the newest versions of programs and applications. Since all applications run off of a connection to the server and the Midwest Computech cloud system, expensive and complicated hardware is not necessary.**
- **You can determine which applications each user has access to and any settings, abilities, and features necessary. Network security is maintained with each user having a completely customized experience.**
- **Users will have the same look and feel of their office system anywhere they login to the system. As long as there is an internet connection, TruCloud™ brings their files and applications to them.**
