

## What is your business' backup plan? What will happen to the files and systems your business relies on if you have a building or server failure?

Data security is crucial to any business, whether large or small. Knowing that data can be quickly and efficiently restored in the case of server or building failure is essential. Midwest Computech's SafetyNet™ system provides efficient and effective backup that you can be sure is working properly.

### SafetyNet™

- Combines an on-site backup server for fast backups and restores with low-cost off-site storage in replicated data centers out of state
- Image based disk to disk backups are done multiple times each hour to both backup systems, eliminating the need for costly and ineffective tape backup systems.
- Highly skilled Midwest Computech Remote Support Staff monitor your system and are notified of any issues.
- In the event of server failure, Midwest Computech will have you up and running shortly, working off of the backup server. Data is current within minutes of the failure and functions just like the server. Continuous backups begin immediately to insure data continuity.
- If your facility and backup server become damaged due to fire or natural disaster, the off-site data collection center does a Bare Metal Restore to dissimilar hardware and will have your system up and ready for use in a timely manner.

## Where is technology taking your business?

- Flexible restore technology allowing for multiple versions of files to be restored.
- Near Line High Availability & Failover, with the backup server running shortly after server failure.
- On and off-site backup solution with multiple restore points.
- Virtualization of failed servers decreases downtime from work.
- No need for costly tapes, off-site storage facilities and downtime waiting for restores.
- Regular checks of both the on and off-site systems are preformed by Midwest Computech technicians.
- Bundles off-site storage (current/archive) for client sites with servers under Server Watch or Remote Server Care program available.

“The security, confidentiality and integrity of our data is of the utmost importance. The peace of mind provided by the SafetyNet off-site system is extremely valuable to us. With the SafetyNet, we know that our backup data is current, safe, secure and the system monitored 24 hours per day. This is worlds better than our previous backup system.”
